---

We now support the ppp device on most of our servers. This device allows for the pptpd service to run inside servers, allowing easy VPN setup for Windows Clients.

We have also create a new template, called 'Instant VPN' to take advantage of this. This template requires zero configuration on the server and zero software installation on the client.

The use of the Microsoft VPN client, which is built into MS Windows XP, Vista and 7 is fully supported.

If your node does not yet support /dev/ppp and you wish to use it instead of OpenVPN, contact support and ask to have your server migrated to another node.
