---

Just started a VPS from yourselves and am having an odd issue:

I have set it up for [www.mumbleforgamers.com](http://www.mumbleforgamers.com)  
I have set the nameservers to [ns1.vpsville.ca](http://ns1.vpsville.ca) and [ns2.vpsville.ca](http://ns2.vpsville.ca) at my registrar.

If you check it out on [intodns.com](http://intodns.com), you can see that the nameservers are in use:

<link>[www.intodns.com/mumbleforgamers.com](http://www.intodns.com/mumbleforgamers.com)

However, [mumbleforgamers.com](http://mumbleforgamers.com) is still using the registrars holding page.

IF you try a random subdomain though, it brings you to the holding page on the vps: example:

<link>[www.random.mumbleforgamers.com](http://www.random.mumbleforgamers.com)

I have added the domain to the DNS on you control panel, and set the reverse DNS.

Any ideas what is causing this?

Most likely it is a DNS propagation issue, with the lookups for the sub-domains going through to the new nameservers, but the main domain still picking up the cached IP addresses of the holding page.

In my experience it normally takes a day or two for all the DNS caches out there to update their stale entries.
