Hi.
I have Magento site with very large catalog.
It has over 20,000 products and growing.

Due to large catalog, Images and Cache size is very large.

Will your VPN server in Toronto be able to handle our magento site?

I do not want to move and find out that it cannot handle the load. Please let me know if you have similar size customer in your server and it's working excellent for them.

Thank you and looking forward to hearing back.

Kevin.

Our website is

www.kiddingawound.com

Hi,

Yes, a VPS can handle that, as it has access to the same resources as a dedicated server. You can start with a small plan and upgrade if performance is not satisfactory.
