Hey All,

2 quick questions regarding DNS setup on the new LXAdmin / Kloxo site.

I have 1 domain name registered for my VPS which will act as the admin account / reseller account which will host several other domain names and sites as clients in Kloxo. I have entered this domain name into the DNS from the VPS login panel. This makes sense as this will have a mail, www, ftp as subdomains.

1) Do I need to enter the domain names of all the clients we will host in there also or is this taken care of in Kloxo settings when setting up clients? Do they all need to be there or just my main server / reseller account?

2) Same question but regarding the Reverse DNS lookup section... Do they all need to be there or just my main server / reseller account?

Thanks in advance.

If you use our DNS servers, it will point all possible subdomains to the IP you setup.

If you use the Kloxo DNS instead, you'll have to setup that manually.
