
Subject: USB devices temporarily lose power after startup

Hello,

I'm having a problem with USB devices being disconnected/turned off when my computer initially starts up. I have a USB headset, USB keyboard, and USB mouse, and when I turn on my computer and log into Windows, all of them will entirely stop working several times during the first couple of minutes after startup. All of the devices completely lose power and will not work for a few seconds, and then they'll start working again, and this will happen maybe five times or so. This happens whether I'm using the case's front ports or the motherboard's built-in ports, and whether I'm using USB 3.0 or 2.0.

I didn't find the right solution from the internet.
